FIG 1 SCHEMATIC - Control Panel

FIG 2 OUTLINE - Control Panel

1.0

INTRODUCTION

The purpose of this manual is to outline calibration, operation, and maintenance procedures.

1.1

The Model 130 Combustible Gas Detection equipment represents a new approach to the old problem of discovering potentially hazardous gas concentrations before they become explosive.

The Model 130 is a unique application of miniaturized solid-state electronics to a catalytic AC bridge. The bridge, which is completely surrounded by a sintered flame arrester, is located in the hazardous area. Continuous gas sampling is accomplished by diffusion and convection.

1.2

There are two types of detectors:

TYPE I - General hydrogen, propane, and similar hydrocarbons except for methane.

TYPE II - Hydrogen, will not respond to hydrocarbons.

1.3

The readout and controls can be situated up to 2000 feet from the hazardous area without the need for additional amplification.

2.0

DESCRIPTION

2.1

The Model 130 consists of a Control Panel, a Remote Detector Probe, and a Sensing Element.

2.1.1

The Remote Detector Probe houses the Sensing Element that is a catalytic AC bridge element. The Sensing Element is completely surrounded by a sintered flame arrester.

- 2.1.2 The Control Panel has all the adjustments, indicators and controls for complete operation of the system.
- The Control Panel is a standard 19 inches wide and 3 1/2 inches high. The chassis extends to the rear a maximum of 7 inches.
- 2.1.2.1 The meter reads 0 to 100% of L.E.L. of gas being detected.
- 2.1.2.2 ALARM LEVEL adjustment is used to establish the point at which the alarm will actuate. The ALARM LEVEL is adjustable from 0 to 100% of the Lower Explosive Limit (L.E.L.)
- 2.1.2.3 ALARM light is illuminated whenever the concentration of gas being detected reaches the setting on the ALARM LEVEL adjustment.
- 2.1.2.4 UNIT TEST is a press-to-test the system switch. The switch is pressed to test the system, simulating an alarm condition.
- 2.1.2.5 POWER toggle switch is system power ON-OFF switch.
- 2.1.2.6 ELEMENT ON light indicates when the Sensing Element is functioning properly.
- 2.1.2.7 AUXILIARY ALARM toggle switch is used to turn on or off an external alarm, if connected, and an internal buzzer.
- 2.1.2.8 ALARM RESET switch gives the option of a latching alarm system or automatic reset position.
- 2.1.2.9 ZERO potentiometer is used to balance detection bridge.
- 2.1.2.10 CALIBRATE potentiometer is used to calibrate system.
- 2.1.2.11 PHASE potentiometer compensates for capacitance unbalance in connecting line.
- 2.1.2.12 Located on the printed circuit board are three potentiometers and a variable resistor.

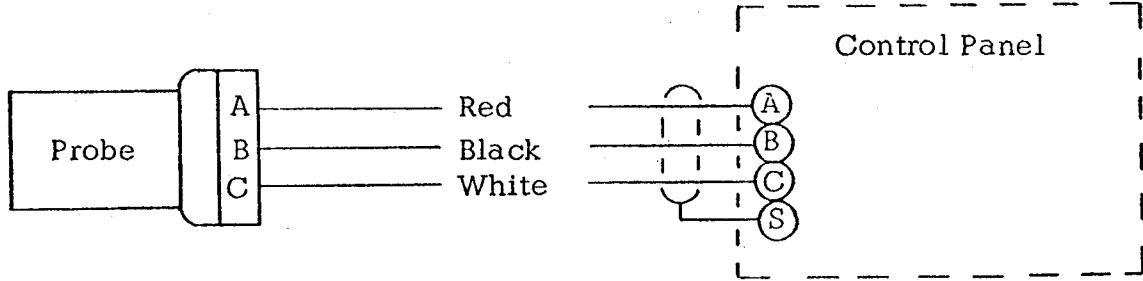

- a. FILTER TUNE (R20) - Factory set
- b. ALARM CALIB (R37) - Factory set
- c. METER BIAS (R42) - Factory set
- d. R39 - Adjusts element current.

2.1.2.13 The Control Panel has a relay which provides 5 ampere alarm contact closures and a 5 ampere 117 VAC alarm signal.

3.0 INSTALLATION

3.1 Install the Remote Detector Probe in the area to be monitored and connect to the control unit with 2000 feet or less of three conductor, 18 gauge, shielded cable using standard electrical techniques. Do not ground the shield at the probe end.
Contact factory for applications over 2000 feet.

The cable shall be connected as follows:

3.2 The Remote Detector Probe should be installed with sintered guard pointing down.

3.3 The control panel can be mounted in any standard 19 inch cabinet.

3.3.1 Connect 117 VAC $\pm 10\%$ 50-60 ~Hz power source to the terminals at the rear of printed circuit board as follows:

117VAC LINE to terminal 12

117VAC NEUTRAL to terminal 13

EARTH GROUND to terminal 14

DO NOT TURN POWER SOURCE "ON"

- 3.4 If external alarms are to be connected, see Figure 1 for correct terminals.

4.0 OPERATION

4.1 Calibration

Do not change any adjustments not called for in the following procedure as they are factory pre-set.

- 4.1.1 Ensure POWER switch is OFF. Position AUXILIARY ALARM switch to OFF. Set pointer knob on ALARM LEVEL adjustment to 100% L.E.L.

- 4.1.2 Loosen sliding wiper on R39 and slide wiper to bottom and re-tighten.

- 4.1.3 Check to see if proper bulb is installed in ELEMENT ON light socket.

TYPE I Sensing Element uses bulb #1815

We have 1815 bulbs

TYPE II Sensing Element uses bulb #43

- 4.1.4 Turn on 117VAC power source and position POWER switch to ON. ALARM light may illuminate.

- 4.1.4.1 After ELEMENT ON light is illuminated, set element current by adjusting R39 for normal brightness (bright-yellow-orange) of ELEMENT ON light. Raising wiper on R39 increases brilliance

- of ELEMENT ON light. Note: If element current is set too high, ELEMENT ON light will burn out, protecting sensing element.
- 4.1.5 Wait approximately one minute and adjust CALIBRATE potentiometer for approximately 80% full scale reading on meter. ALARM light will extinguish. Adjusting CALIBRATE potentiometer clockwise (CW) will raise reading and counter-clockwise (CCW) will lower reading.
- 4.1.6 Slowly adjust ZERO potentiometer for lowest reading on meter. When no further improvement can be noted, adjust PHASE potentiometer for minimum reading on meter. Turn CALIBRATE potentiometer CW and repeat.
- 4.1.7 Repeat steps 4.1.5 and 4.1.6 until CALIBRATE potentiometer is full CW.
- 4.1.8 Extend Sensing Element to Calibration Chamber (General Monitors Part No. 14 00 100) using extension cable furnished with Calibration Chamber and mix gas sample of 50% L.E.L.
- 4.1.8.1 Adjust CALIBRATE potentiometer until meter reads 50% L.E.L.
- 4.1.8.2 Replace Sensing Element into probe.
- 4.1.8.3 Slowly adjust ZERO potentiometer for lowest reading on meter. When no further improvement can be noted, adjust PHASE potentiometer for minimum reading on meter.
Unit is calibrated.
- 4.1.9 Set ALARM LEVEL pointer to desired alarm level.

- 4.2 Calibration required
- Unit must be recalibrated if:
- 4.2.1 The Sensing Elements are changed.
- 4.2.2 The cable connecting the detection probe to the Control Panel is greatly shortened or lengthened.
- 4.2.3 Unit should be recalibrated every 60 days.
- 5.0 MAINTENANCE
- 5.1 ELEMENT ON light will not illuminate.
- 5.1.1 Possible Cause: Defective bulb
Corrective Action: Replace bulb
- 5.1.2 Possible Cause: Remote detector probe not connected to control panel properly.
Corrective Action: Connect to Control Panel per Paragraph 3.1
- 5.1.3 Possible Cause: Sensing Element not installed in remote detector probe.
Corrective Action: Install Sensing Element
- 5.1.4 Possible Cause: Fuse defective
Corrective Action: Replace fuse
- 5.2 ELEMENT ON light illuminates very brightly or burns out.
- 5.2.1 Possible Cause: Sensing Element or interconnecting cable shorted.
Corrective Action: Repair as necessary
- 5.2.2 Possible Cause: R39 adjusted improperly
Corrective Action: Lower setting on R39

- 5.3 ALARM light illuminated constantly
- 5.3.1 Possible Cause: ALARM LEVEL set at 0% L.E.L.
 Corrective Action: Set ALARM LEVEL above 0% L.E.L.
- 5.3.2 Possible Cause: Gas present at detector probe
 Corrective Action: Remove source of gas
- 5.3.3 Possible Cause: Relay malfunction
 Corrective Action: Replace relay K1
