Okta says security breach disclosed in October was way worse than first thought

A security breach of identity-management software company Okta was more extensive than first thought.

More than five weeks after Okta first told customers of the September breach, the company's chief security officer, David Bradbury, wrote in a blog post Wednesday that hackers had stolen information on all users of its customer support system.

The admission is a far cry from the company's prior contention that the incident had impacted less than 1% of users.

"**MFA is an increasingly outdated way of thinking about things**. What's important is how credentials can be combined with recognition, affirmation, and risk signals to provide sufficient trust in an identity claim."

– Ant Allan, Gartner at 2024 Gartner IAM Summit
